

3 STAGE FOGGING PROGRAM

(One gallon Evictor covers approximately 1200 sq. ft)

Experts agree: Insect are difficult to control, and no one treatment or technique has been found to be effective in all cases. Still, insects can be controlled through a combination of techniques known as integrated pest management (IPM) – an environmentally sensitive approach that includes prevention, monitoring, and limited use of chemical pesticides.

Preparing your home for spraying and fogging

In order for you to effectively treat your indoor structure it must be prepared accordingly. Unfortunately, the preparation process can be a stressful and time-consuming process; but that's where our preparation instructions will help. By using our insect treatment preparation instructions, you will be able to treat areas of concern that would otherwise be inaccessible. The following is our suggested process:

Stripping Beds

- Sanitizing of mattress, box spring, covers, sheets, and pillowcases.

Dismantling

- Dismantle your bed, separating the headboard and footboard from the bed frame. This allows you to thoroughly treat the structure of your bed.

Emptying

- Empty dressers, wall units, book shelves, night stands, and other furniture; contents should be sanitized, bagged, sealed, and placed in another room or outside until job is finished. Any items situated on the floor such as clothing, toys, clutter, etc. should also be sanitized, bagged and sealed.
- All pictures hanging on the wall should be vacuumed, sanitized, and wrapped.

Vacuuming Bed Bugs

- Using a vacuum you will vacuum all box springs, mattresses, bed frames, nightstands, tables, chairs, couches, baseboards, rugs, and pictures.

Laundry

- It is best that all hanging clothes are sent to a laundry facility.
- Laundry should be removed from closets and dressers, sorting whites from darks, and placed into clear plastic bags. Sealed laundry bags should be placed in another room or outside, out of your way.

Perimeter Preparation

- Move couches, wall units, beds, dressers, end tables, nightstands, and all other obstructions three feet from the wall to make the perimeter areas accessible

Preparing for initial treatment

STAGE 1: Adjoining Rooms of indoor structure

you're now ready to start treating in "adjoining" rooms with a hand held or back-pack pump sprayer

NOTE: By sealing up the areas described below you will help in the prevention of any additional bugs passing through these areas when you start on the main room.

1. Your first agenda should be to unscrew all switch & plug covers (Turn Off Power) and then put DE (Diatomaceous Earth) in all plug and switch openings using a pest pistol powder duster. When completed replace covers. Turn power back on.
2. Spray Dr. Bens Evictor along baseboards in adjoining rooms (Make sure to get between wall and baseboard if possible) where gaps are present, fill with clear caulk.
3. Apply clear caulk to seal crevices and joints under sinks in shelves & cabinets.
4. Spray under any loose carpeting
5. Visually look and inspect the upper corners of walls and behind any lose wall paper for signs of eggs or bed bugs. Spray back of wall paper, when back has dried, glue down.

NOTE: By sealing up the areas described above you will help in the prevention of any additional bugs to pass through these areas when you start on the main room.

STAGE 2: Main Room

Start by spraying with a hand held or back-pack pump spray apparatus

NOTE: DO NOT FOG WITHOUT FIRST SPRAYING AREAS OF CONCERN

1. Your first agenda should be to unscrew all switch & plug covers (Turn Off Power) and then put DE (Diatomaceous Earth) in all plug and switch openings using a pest pistol powder duster. When completed replace covers. Turn power back on.
2. Spray Dr. Bens Evictor along baseboards in adjoining rooms (Make sure to get between wall and baseboard if possible) where gaps are present, fill with clear caulk.
3. Apply clear caulk to seal crevices and joints under sinks in shelves & cabinets.
4. Spray under any loose carpeting
5. Visually look and inspect the upper corners of walls and behind any lose wall paper for signs of eggs or bed bugs. Spray back of wall paper, when back has dried, glue down.
6. Spray inside cavities of dresser very well (corners especially) Spray dresser drawers inside, underneath and sides NOTE: make sure you flip up the dresser and any night stands. Spray underneath the entire piece of furniture.
7. After inspecting pictures and frames, if any sign of eggs or bed bugs are present wipe down & spray
8. Spray down mattresses especially in the fold or crease of the mattress (Dr. Bens does not stain)
9. Spray inside of Box spring making sure all wood framing especially corners are wet.
10. Spray down entire bed frame metal or wood looking for cracks or hollow holes. Seal any holes, cracks and hollow holes.
11. Spray down head board concentrating on the cracks around the framing.
12. Spray underneath cabinets in bathroom making sure to include upper part of cabinet
13. Spray all living room furniture including under cushions, sides and bottom of couch, (For Leather test small area first). Spray under chairs including all other furniture in room

WHEN USING DR. BEN'S EVICTOR FOR FLEAS, TICKS, ROACHES, ANTS OR OTHER INSECTS **OR** IMPLEMENTING A MAINTENANCE PROTOCOL YOU SHOULD FOLLOW THE PROTOCOL UP TOP FOR FIRST INITIAL APPLICATION FOLLOWED UP WITH BI-MONTHLY SIMPLE SPRAY APPLICATIONS...

However If bed bugs are present and you want to perform a fogging continue to follow instructions below...

STAGE 3: Preparation of rooms for fogging.

IMPORTANT NOTICE: (DON'T FORGET)

- **DO NOT FOG WHEN PEOPLE OR ANIMALS ARE PRESENT**
- **Turn off all fire alarms**
- **Turn off all pilot lights/furnaces Do Not Spray or fog into flames under any circumstances.**
- **Close all windows**
- **Turn off AC**
- **Wear mask while fogging**
- **Wear goggles while fogging**

IMPORTANT NOTICE: Do Not Simply Set the Fogger in the middle of room and Fog, it is a hand held fogger and should be used accordingly. Follow instructions below in stage 3.

Remove all pets (ALL)

Place a towel on the floor at the bottom of the front door, so the mist does not leach into the halls.

IMPORTANT NOTICE: Put on protective mask and goggles Once this is accomplished you can now start fogging...

Beginning in the farthest room from the front entrance, Apartment, Condo, House or if attic is available.

As you just used the hand held sprayer in the directions above, you will now repeat the same steps, except you will use the fogger. You will fog at a distance of approximately 24 inches from everything that you just sprayed; this will ensure good penetration of the Solution deep inside the cracks and crevices. As you are spraying these area's you want to make sure you are also spraying the entire flooring area baseboards, carpet, tile and wood flooring. Make sure you treat/fog under furniture and in closets until you reach the exit door.

Prior to leaving the room, (when you reach the exit), point the fogger straight in the room, turn on high and fog until there is a dense fog in the air. When it is hard to see through the fog, pick up your towel at the bottom of the doorway, open the door and close as quickly as possible then put the towel along the outside of the door so that the solution doesn't leech out to the hall.

Start on next room (if applicable) and repeat the same protocol as the first room.

You will leave the room closed up for a minimum of 3 hours preferably 24 hours prior to re-entering.

Upon re-entry, open up all windows and turn on ceiling and portable fans so that the air will circulate and go out windows and doors. Do not use AC for airing out the structure as you may get the aroma of cedar into the filter and other areas that will take a while to get rid of. You can now wipe down the tops of all counter tops. (DO NOT VACUUM, allow all furniture and carpeting to dry naturally) this gives the product enough time to dehydrate any eggs.

Upon re-entry, open up all windows and turn on ceiling and portable fans so that the air will circulate and go out windows and doors. **Do not use AC for airing out the structure as you may get the aroma of cedar into the filter and other areas that will take a while to get rid of.** You can now wipe down the tops of all countertops. (DO NOT VACUUM right away, allow all furniture and carpeting to dry naturally) this gives the product enough time to dehydrate any eggs. You should vacuum in approximately 24 hours from time of initial spray.

As you re-enter structure inspect for any movement of live insects. Although there should not be any bed bugs alive at this time, there is always a chance that some simply did not die, repeat instructions only, when necessary.
